                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel humanized anti-Fas antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between Eas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral, immunomodulatory, dermatological, immunosuppressive, thyromimetic,
inducing a human anti-murine antibody response. This sequence represents a humanised anti-Fas antibody heavy chain construct designated Heu 1 which is described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems
                                                                                                                                                                                                                               Gaps

antirheumatic, nephrotropic, antiinfertility, neuroprotective,
antiarteriosclerotic, cardiant and hepatropic activity. (I) induce
apoptosis by binding to cell surface Fas or inhibit it by competitive
inhibition of ligand binding. (I) are used to treat and/or prevent
diseases associated with the Fas/Fas ligand system, especially systemic
disease, sociated with the Fas/Fas ligand system, especially systemic
c upus erythematosus, Hashimoto disease, rheumatoid arthritis, graft
versus host disease, soleroderma, Goodpasture syndrome, Crohn's
disease, autoimmune hemolytic anemia, sterility, myasthenia gravis,
antipibe sclerosis, Basedow's disease, thrombopenia purpura, insulin
dependent diabetos mellitus, allergy, arteriosclerosis, myocarditis,
cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral
CE, C or D) or alcoholic), and transplant rejection. (I) selectively
inhibit apoptosis in normal cells but selectively induce it in abnormal
cells. They bind to both human and murine Fas, so can be evaluated in
murine disease models. (I) act on the active site of Fas, i.e. they mimic
the native ligand, do not induce liver disease, and have reduced risk of
inducing a human anti-murine antibody response. This sequence represents
a humanised anti-Fas antibody heavy chain construct designated Heu 2.
which is described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ó

This invention describes a novel numbrized anti-ras anticody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas [1gand system, by binding to Fas on the cell surface, and prevents capoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, antidabetic, anti-allergic, anti-arthritic, antiviral, immunomodulatory, dermatological, immunosuppressive, thyromimetic, antiarteriosclerotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive confinition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic diseases associated with the Fas/Fas ligand system, especially systemic confinition of ligand binding. (I) are used to treat and/or prevent disease, solorgen's syndrome, pernicious or hypoplastic conemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, autoimmune hemolyfic anemia, sterility, myasthenta gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively (B, C or D) or alcoholic), and transplant rejection. (I) selectively (I) the native ligand, do not induce liver disease, and have reduced risk of the native ligand, do not induce liver site of Fas, i.e. they mimic inducing a human anti-murine antibody response. This sequence represents a humanised anti-marine antibody heavy chain construct designated Heu 3 which is described in the method of the invention.
                                                                                                   New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel humanized anti-Fas antibody-like

Igheavy chain V region (clone 7A.1) - mouse (fragment)

C.Species: Mus musculus (house mouse)
C.Species: Mus musculus (house mouse)
C.Species: No.Sep-1993 #sequence_revision 30-Sep-1993 #text_change 16-Aug-1996
C.Accession: PH1160
R.Schittek, B.; Rajewsky, K.
A.Title: Natural occurrence and origin of somatically mutated memory B cells in mice.
A.Reference number: PH1105; MUID:92364545
A.Accession: PH1165
A.Accession: PH1166
A.Residues: 1-98 «SCH»
A.Residues: 1-98 «SCH»
A.Residues: 1-98 region; immunoglobulin homology
C.Superimental source: B cell
C.Superfamily: immunoglobulin homology < Immunoglobulin homology
F;15-98/Domain: immunoglobulin homology < IMM>

68.7%; Score 169; DB 2; Length 98; 30.9%; Pred. No. 2e-05;

Description

as;

~

This invention describes a novel numanized anti-Fas antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents capprosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, antidabetic, anti-allergic, anti-arthritic, antiviral, immunosuppressive, thyromimetic, antiarterioscierotic, cardiant and hepatropic activity. (I) induce antiarterioscierotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive antiarterioscierotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive (disease associated with the Fas/Fas ligand system, especially systemic disease associated with the Fas/Fas ligand system, captions. (I) safety are synthemia gravis.

C disease, sociated with the Fas/Fas ligand system, con hypoplastic or anemia, Addison's disease, relemancial arthritis, graft oversus host disease, soleroderma, Goodpasture syndrome. Crohn's disease, autoimmune hemolytic anemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminat, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively cells. They bind to both human and murine fass so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they minic cells. They bind to both human and murine fass so can be evaluated in inducing a human anti-murine antibody response. This sequence represents a humanised anti-Fas antibody heavy chain construct designated Heu I which is described in the method of the invention. infilammatory or autoimmune disease, induces apoptosis selectively in This invention describes a novel humanized anti-Fas antibody-like Tamaki I, Takahashi T; cells with abnormal Fas-Fas ligand systems Claim 2; Page 169-170; 263pp; English. treating or preventing e.g. apoptosis selectively in New humanized anti-Fas antibody, useful for inflammatory or autoimmune disease, induces cells with abnormal Fas-Fas ligand systems

2000-258930/23. N-PSDB; AAA11645 Claim 2 ; Page 174-176; 263pp; English.

This invention describes a novel humanized anti-Fas antibody-like
molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas
ligand system, by binding to Fas on the cell surface, and prevents
apoptosis in cells with a normal system, by inhibiting binding between
CF and its ligand. The products of the invention have anti-inflammatory,
anti-anemnic, antidiabetic, anti-allergic, anti-arthritic, antiviral,
immunoamodulatory, dermatological, immunosuppressive, thyromimetic,
antirheumatic, nephrotropic, antiinfertility, neuroprotective,
antirheumatic, nephrotropic, antiinfertility, neuroprotective
antirheumatic, nephrotropic, antiinfertility, neuroprotective
antirheumatic, nephrotropic, antiinfertility, neuroprotective
antirheumatic, hephrotropic, antiinfertility, neuroprotective
antiphotision of ligand binding. (I) are used to treat and/or prevent
diseases associated with the Fas/Fas ligand system, especially systemic
upus erythematosus, Hashimoto disease, rheumatoid arthritis, graft
versus host disease, Sjorgen's syndrome, pernicious or hypoplastic
anemia, Addisease, Siorgen's syndrome, speciality, mysathenta gravis,
multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin
dependent dabetes mellitus, allergy, arterioscilerosis, myocarditis,
cardiomyopathy, glomerulonephritis, hepatlatis (fulminant, chronic, viral
(B, C or D) or alcoholic), and transplant rejection. (I) selectively

inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they mimic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents a humanised anti-Fas antibody heavy chain construct designated Heu 2 which is described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                        240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   300

```
This is the amino acid sequence of the HV type humanised heavy chain of murine anti-human Fas monoclonal antibody HFB7A. It includes humanising R4G and A76T amino acid substitutions that are includes humanising R4G and A76T amino acid substitutions that are are conserved in the human igG heavy chain. Host Escherichia coli pyHPDHV3 SANK 70298 harbors plasmid pgHPDHV3 carrying a fusion fragment of the humanised HV type HFB7A heavy chain and DNA croducing human igGl constant region (see AAV70080), and is deposited as FERM BP-6273 (Claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFB7A (see AAW83031-37), like native HFB7A, are capable of inducing apoptosis in abnormal cells expressing Fas, and of antibodies are used to evaluate, in onimal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune disease (e.g. systemic lupus erythematosus, Hashimoto's disease, graft versus host disease, soleroderma, Goodpasture syndrome, Crohn's disease, graft versus host disease, solutoimmune haemolytic anaemia, sterility, myasthenia gravis, multiple scl rosis, Basedow's disease, thrombopenia purpura and insulin-dependent diabetes), allengies, atopy, arteriosclerosis, multiple scl rosis, Basedow's disease, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerular nephritis, hypoplastic myocarditis, cardiomyopathy, glomerular rejection (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antibodies and proteins bind conserved epitope of Fas antigen - used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis, hepatitis and AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Akio S, Hideyuki H, Hiroko Y, Jun O, Kimihisa I;

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allery, atopy, arterioscierosis, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS represent the heavy chains (or fragments thereof) of various humanised HFETA-derived anti-Fas antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   YSNNWYFDVWGQGTLVTVSSASTKGPSVFPLAPSSKSTSGGTAALGCLVKDYFPEPVTVS 180

This introductor describes a novel numnized anti-ras antibody like molecule (1) that, induces apoptosis in cells with an abnormal Fas/Fas apoptosis in cells with an abnormal Fas/Fas apoptosis in cells with an order of the invention have anti-inflammetory, antidabetic, anti-allergic, anti-arthritic, antiviral, immunosuppressive, thyronimetic, antidabetic, antidiffertility, neuroprotective, antiarteriosolerotic, cardiant and hepatropic activity. (1) induce apoptosis by binding to cell surface Fas or inhibit to prevent apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (1) are used to treat and/or prevent chibibition of ligand binding. (1) are used to treat and/or prevent aboptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand with the Fas/Fas ligand system, especially systemic lupus erythematosus, Hashimoto disease, rheumatoid arthritis, graft versus host disease, sjorgen's syndrome, pernicious or hypoplastic anemia, Addison's disease, relember, pernicious or hypoplastic anemia, Addison's disease, thrombopenia purpura, insulin dependent diabetes menlitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, insulin dependent diabetes menlitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (1) act on the active site of Fas, i.e. they minic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine anti-murine anti-pody HEPA designed heavy chain which is used in the method described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GQGLEWMGEIDPSDSYTNYNQKFKGKATLTVDTSTAYMELSSLRSEDTAVYYCARNRD 120

continuous in cells with a normal system, by inhibiting binding between fas and its ligand. The products of the invention have anti-inflammatory, antidiabelic, anti-arthritic, antidization, contidiabelic, anti-allergic, anti-arthritic, antidization, immunomodulatory, dermatological, immunosuppressive, thyromimetic, antirioratic cardiant and hepatropic activity. (I) induce antiarteriosclerofic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent capoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent consenses associated with the Fas/Fas ligand system, especially systemic liques erythematosus, Hashimoto disease, rheumatoid arthritis, graft oversus host disease, Soloroderma, Goodpasture syndrome, Crohn's disease, autoimmune hemolytic anemia, sterility, myasthenia gravis, anemia, Addison's disease, thrombopenia purpura, insulin calcingmopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively collinging apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they minc inducing a human anti-murine antibody response. This sequence represents a humanised anti-Fas antibody heavy chain construct designated Heu 3 which is described in the method of the invention.

used to evaluate drugs in animal models and to treat Fas-associated allergy, atopy, arteriosclerosis, New antibodies and proteins bind conserved epitope of Fas antigen diseases e.g. autoimmune disease, myocarditis, hepatitis and AIDS

Claim 22; Page 212-213; 292pp; English.

This is the amino acid sequence of the VD type humanised heavy chain of murine anti-human Fas monoclonal antibody HFE7A. E. colipgHSL7A62 SANK 73397 harbors plasmid gpHSL7A62 carrying a fusion fragment of the humanised VD type HFE7A heavy chain and DNA encoding human igGl constant region (see AAV70079), and is deposited as FERM BP-6074 (claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFE7A (see AAW83031-37), like native HFE7A, are capable inducing apoptosis in abnormal cells expressing Fas, and of inhibiting Fas-induced apoptosis in normal cells. The humanised antibodies are used to evaluate, in animal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the tracement or prevention of conditions such as autoimmune diseases, allery, acopy, arterioscierosis, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS represent the heavy chains (or fragments thereof) of various humanised HFETA-derived anti-Fas antibodies.
                                                                                                                                                                                                   for the diseases caused by an abnormality
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            wnsgaltsgvhtfpavlgssglyslssvvtvpssslgtgtyicnvnhkpsntkvdkrvep 240

New humanized anti-Fas antibody, useful for treating or preventing e.g. cells with abnormal Fas-Fas ligand systems

Example reference 15; Page 134-136; 263pp; English.

This invention describes a novel humanized anti-Fas antibody-like

molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas

ligand system, by binding to Fas on the cell surface, and prevents

co apoptosis in cells with a normal system, by inhibiting binding between

Fas and its ligand. The products of the invention have anti-inflammatory,

contianemic, antidiabetic, anti-allergic, anti-arthritic, antiviral,

immunomodulatory, dermatological, immunosupressive thyromimetic,

antirheumatic, nephrotropic, antiinfertility, neuroprotective,

antirheumatic, nephrotropic, antiinfertility, neuroprotective,

contianterioscleroric, cardiant and hepatropic activity. (I) induce

apoptosis by binding to cell surface Fas or inhibit it by competitive

antinhibition of ligand binding. (I) are used to treat and/or prevent

confiseases associated with the Fas/Fas ligand system, especially systemic

confiseases associated with the Fas/Fas ligand system, especially systemic

confiseases associated with the Fas/Fas ligand system, competitics, or serial and arthritis, graft

versus host disease, Sjorgem's syndrome, pernicious or hypoplastic

consultable sclerosis, Basedow's disease, thrombopenia purpura, insulin

consultable sclerosis, Basedow's disease, thrombopenia purpura, insulin

consultable mellitus, allergy, arteriosclerosis, myocarditis,

cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral

(B, C or D) or alcoholic), and transplant rejection. (I) selectively

colls. They bind to both human and murine Fas, so can be evaluated in

murine disease models. (I) act on the active site of Fas, i.e. they mimic

cells. They bind to both human and murine Fas, so can be evaluated in

murine disease models. (I) act on the active site of Fas, i.e. they mimic

cells. They bind to both human and murine Fas, so can be evaluated in

murine disease models. (I) act on the active site of Fas, i.e. they mimic

the native ligand, do not induce liver disease, and have reduced risk of

the mathod described in the i

Into Introductor describes a nover numerized anti-ras antibody-like molecule (1) that, induces apoptosis in cells with an abnormal Fas/Fas apoptosis in cells with an abnormal Fas/Fas apoptosis in cells with an operation building binding between geoperasis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral, immunomoulpressive, thyronimetic, antidiabetic, antidifertility, neuroprotective, antiarconforced, and antiarconforced, a
                                                                                                                                                                         New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in

The invention relates to a compound which comprises a target cell-specific portion, comprising an humanised monoclonal antibody, having specificity for polymorphic epithelial mucin (PEM) or its antigen binding fragment and a cytoctoxic portion having endonucleolytic activity, exemplified by AAM52154-AAM52168 and encoded by ABA02682-ABA02728. The compound has cytostatic activity useful for treating cancer and acting as a potential inducer of apoptosis.
                                                                                                                                                                                                    Humanised monoclonal antibody; polymorphic epithelial mucin; PEM1;

The compound has cytostatic activity useful for treating cancer and acting as potential inducer of apoptosis.
                                                                                                                                                                                                                                                                                                                                            polymorphic epithelial mucin; PEM1;
I; human; cytostatic; cancer; apoptosis.

having specificity for polymorphic epithelial mucin (PEM) or its antigen binding fragment and a cytotoxic portion having endonucleolytic activity, exemplified by AAM52154-AAM52168 and encoded by ABA02682-ABA02728. The compound has cytostatic activity useful for treating cancer and acting as a potential inducer of apoptosis.

                                                                                                                                                                                                                                                                                The invention relates to a compound which comprises a target cell-specific portion, comprising an humanised monoclonal antibody, having specificity for polymorphic epithelial mucin (PEM) or its antigen binding fragment and a cytotoxic portion having endonucleolytic activity, exemplified by AAM$2124-AAM$2168 and encoded by ABA02582-ABA02728. The compound has cytostatic activity useful for treating cancer and acting as a potential inducer of apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        YSNNWYFDVWGQGTLVTVSSASTKGPSVFPLAPSSKSTSGGTAALGCLVKDYFPEPVTVS 180

Sequence 14, Application US/08887352B
Patent No. 5994511
GENERAL INFORMATION:
APPLICANT: Henry B. Lowman, Leonard G. Presta, Paula M. Jardieu, John Lowe
TITLE OF INVENTION: Improved Anti-TgE Antibodies and Method of
TITLE OF INVENTION: Improving Polypeptides
NUMBER OF SEQUENCES: 26
